

INTERNAL BRIEF

Website Redesign Plan — ubcbim.com

A short overview of why we are redesigning our website and what the new site needs to deliver. For internal review and discussion.

1. Why We Are Doing This

Our website holds strong content — our services, client testimonials, the machines and software we support, and our track record across all the countries we serve and hundreds of projects. The issue is presentation. **The current site looks like a traditional brochure rather than a technology company**, and it gives visitors only one way to reach us: a single contact form.

Competitors in our space are setting a higher bar. As a reference point, NexGen Steel runs an interactive **3D Virtual Lab** where a visitor can pick a project, rotate the 3D model in their browser, read its specifications and the machines used, and request a quote — all on one page. It immediately signals a serious, modern engineering business. We offer a broader range of services; we need to present them with the same level of polish.

Our goal

Keep our proven content, redesign it into a modern technology brand, add an interactive 3D project showcase and sample files, and make it effortless for clients to reach us — with every enquiry captured automatically in our CRM.

What the new site must achieve

1. Look and feel like a technology company, not a contractor brochure.
2. Prove our capability visually — an interactive 3D model showcase plus downloadable sample files.
3. Give clients several easy ways to reach us: live chat, online call booking, and quote buttons throughout.
4. Capture every lead automatically into our CRM, and use social media to bring in more visitors.

2. Where We Stand Today

A simple comparison of our current site against the interactive benchmark helps make the priorities clear.

Area	Our site today	What strong sites do	Priority
First impression	Photo slideshow with text	Live, interactive 3D showcase	High
Showing our work	Static images	Spin-and-zoom 3D models	High
Project detail	None shown	Specs: size, type, machines used	High
Turning interest into a lead	One contact page	Quote button on every project	High
Talking to us	Phone, email, form	Live chat + online booking	High
Sample files	Not offered	Downloadable, gated samples	Medium
Look & feel	Light, stock photos, carousels	Modern, deliberate design system	Medium
Social media	Small footer links	Prominent icons + embedded feeds	Medium

Worth noting

We already maintain the assets that make a company look credible online — named client testimonials, the roll-forming machines and software we support, association memberships, and global reach. The redesign is largely about presenting these inside a modern, interactive experience.

3. The Key Priorities

3.1 An interactive 3D Project Lab (our centerpiece)

This is the feature that will most change how the site feels. We can export finished Revit models to a web 3D viewer (for example, Sketchfab, which has a free Revit plug-in) and embed them on our pages, so visitors can rotate and zoom with no software to install.

Each project should show:

- **The 3D model** (rotate, zoom, fullscreen).
- **A specs panel:** size, units, location, building type.
- **Capability tags:** the machine(s) and software used, and what we delivered (model, BOM, CSV, permit set).
- **Two actions:** “Download sample files” and “Request a similar quote.”
- **Filters** by Residential / Commercial / Multifamily / Light-Gauge Steel / Wood.

Recommended start: 8–12 of our best wood and light-gauge steel projects for launch, then grow the library over time.

3.2 Easy ways for clients to reach us

- **Live AI chat widget** on every page, logged into our CRM.
- **“Book a 15-minute call” scheduler** so clients pick a time directly — helpful across time zones.
- **WhatsApp / quick-call button** for messaging-first clients.
- **A sticky “Request a Quote” button** that stays visible while scrolling, plus quote buttons inside the 3D Lab.

3.3 Capturing every lead in our CRM

Every contact form, quote request, chat, and file download should land in our CRM automatically — assigned to the necessary team members and tagged with where it came from. The simplest reliable method is embedding **web-to-lead forms** built inside the CRM (we already have it on our current site), with auto-assignment and lead-source tagging turned on. Live chat and online booking feed the same records, so nothing is missed.

Note: We have already connected CRM with our current website, and have recently connected our Meta account with the CRM. We have to further connect it with LinkedIn and any other lead-generating forms or ways we do it - including the live AI chatbot that we will be integrating into our website.

3.4 Sample files and capability information

Clients evaluate a partner by looking at real deliverables and checking compatibility. A “Resources” hub should offer downloadable, watermarked samples — a sample 3D model, a Bill of Materials, machine CSV files, and a permit set — behind a short form that creates a tagged

lead. A clear capability matrix (machines and software we support, and the file outputs clients receive) answers their main questions at a glance.

3.5 Social media that brings in clients

- **Prominent social icons** in the header and footer, with our latest LinkedIn and YouTube content embedded near the footer.
- **Project walkthrough videos** embedded on the 3D Lab and service pages; short model clips posted to social media linking back to the site.
- **Trackable links** so we can see in our CRM which platform brings each lead and focus effort where it pays off. LinkedIn is our priority channel for B2B clients.

3.6 A modern look and feel

- **One deliberate design system** — consistent colors, fonts and spacing across every page.
- **Real 3D models and renders** instead of stock photos; subtle, purposeful motion rather than carousels.
- **Fast and mobile-first**, with SEO basics (clear headings, page descriptions, image alt text) on every page.

4. How We Can Roll It Out?

The work is phased so we get quick wins early and tackle the larger 3D showcase in parallel — no need to do everything at once.

Phase	Focus	What gets done
1 — Quick wins	Engagement + CRM	Live chat & online booking WhatsApp / call button Forms wired to CRM Sticky quote button Bigger social icons
2 — Core redesign	Look & structure	New design system Rebuilt homepage & services Capability matrix Speed + SEO basics
3 — 3D Project Lab	Differentiator	8–12 interactive models Specs & analysis panels Per-model quote to CRM Filters by building type
4 — Resources & growth	Lead generation	Sample-files hub Embedded social & video Email follow-up Analytics & tracking

1) Turn on live chat and online booking. 2) Connect every form to our CRM. 3) Launch a small 3D Project Lab with 8–12 models.

5. Decisions We Need to Make

5. Design direction — a modern dark “engineering” theme, or a clean light theme with one bold accent colour.
6. Which 8–12 projects to feature first in the 3D Lab.
7. Which sample files we are comfortable sharing (watermarked).
8. Who owns incoming leads, chats and booked calls day to day.

Key questions for whoever that will design the new Website

- Can they implement our CRM web-to-lead forms, live AI chat and online booking, with lead-source tagging and auto-assignment?
- Can they build interactive 3D models with custom specs panels and quote buttons?

- Will the new build be modern, fast and mobile-first, with a documented design system?
- Can they set up gated sample-file downloads that create tagged leads, plus analytics and link tracking?

Internal discussion document for the ubcbim.com redesign. Prepared June 2026.
